

Project Report

UI/UX design for LMS mobile version

By Hasanabbas Momin IMT2020066

Problems and Motivation:

- In IIITB LMS is a core service used by every student and professor to perform all academic activities.
- Talking to my peers and even seniors, it was evident that the user experience was quite bad
- Viewing an assignment was quite tedious, first, we needed to go to the course then the assignment section, and then a particular assignment.
- The calendar section and messaging sections are quite useless, never heard anyone use them.

Vision and Aim:

- To make mobile as well as web-version of LMS to make the user experience great.
- Assignments, exams, and all other deadlines should be present on the first page.
- Make a calendar section such that every assignment, class, quiz, etc can be easily identified.

Sections currently designed:

- Login page (which would require users to log in once a day).
- Home (Dashboard) page with all courses and assignments and quizzes.
- Calander page with assignments and tests highlighted.

Future scope:

- With the right group of web and app developers, we can finish the final product of the new LMS for every student and professor to use.
- Notification for upcoming classes, assignments, and tests.
